

## POWER MANAGEMENT IC FOR LI-ION POWERED SYSTEMS

### FEATURES

- **1.5 A, 90% Efficient Step-Down Converter for Processor Core (VDCDC1)**
- **1.2 A, Up to 95% Efficient Step-Down Converter for System Voltage (VDCDC2)**
- **1.0 A, 92% Efficient Step-Down Converter for Memory Voltage (VDCDC3)**
- **30 mA LDO/Switch for Real Time Clock (VRTC)**
- **2 x 200 mA General-Purpose LDO**
- **Dynamic Voltage Management for Processor Core**
- **Preselectable LDO Voltage Using Two Digital Input Pins**
- **Externally Adjustable Reset Delay Time**
- **Battery Backup Functionality**
- **Separate Enable Pins for Inductive Converters**
- **I<sup>2</sup>C™ Compatible Serial Interface**
- **85- $\mu$ A Quiescent Current**
- **Low Ripple PFM Mode**
- **Thermal Shutdown Protection**
- **40 Pin, 5 mm x 5 mm QFN Package**

### APPLICATIONS

- **Digital Media Players**
- **Internet Audio Player**
- **Digital Still Camera**
- **Digital Radio Player**
- **Supply DaVinci™ DSP Family Solutions**

### DESCRIPTION

The TPS65023 is an integrated Power Management IC for applications powered by one Li-Ion or Li-Polymer cell, and which require multiple power rails. The TPS65023 provides three highly efficient, step-down converters targeted at providing the core voltage, peripheral, I/O and memory rails in a processor based system. The core converter allows for on-the-fly voltage changes via serial interface, allowing the system to implement dynamic power savings. All three step-down converters enter a low-power mode at light load for maximum efficiency across the widest possible range of load currents. The TPS65023 also integrates two general-purpose 200 mA LDO voltage regulators, which are enabled with an external input pin. Each LDO operates with an input voltage range between 1.5 V and 6.5 V, allowing them to be supplied from one of the step-down converters or directly from the battery. The default output voltage of the LDOs can be digitally set to 4 different voltage combinations using the DEFLDO1 and DEFLDO2 pins. The serial interface can be used for dynamic voltage scaling, masking interrupts, or for dis/enabling and setting the LDO output voltages. The interface is compatible with the Fast/Standard mode I<sup>2</sup>C specification, allowing transfers at up to 400 kHz. The TPS65023 is available in a 40-pin (RSB) QFN package, and operates over a free-air temperature of –40°C to 85°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

DaVinci, PowerPAD are trademarks of Texas Instruments.  
I<sup>2</sup>C is a trademark of Philips Electronics.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**ORDERING INFORMATION<sup>(1)</sup>**

T <sub>A</sub>	PACKAGE	PART NUMBER <sup>(2)</sup>
-40°C to 85°C	40 pin QFN (RSB)	TPS65023RSB

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at [www.ti.com](http://www.ti.com).
- (2) The RSB package is available in tape and reel. Add the R suffix (TPS65023RSBR) to order quantities of 2500 parts per reel. Add the T suffix (TPS65023RSBT) to order quantities of 250 parts per reel.

**ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>**

over operating free-air temperature range (unless otherwise noted)

	VALUE	UNIT
V <sub>I</sub> Input voltage range on all pins except AGND and PGND pins with respect to AGND	-0.3 to 7	V
Current at VINDCDC1, L1, PGND1, VINDCDC2, L2, PGND2, VINDCDC3, L3, PGND3	2000	mA
Peak current at all other pins	1000	mA
Continuous total power dissipation	See Dissipation Rating Table	
T <sub>A</sub> Operating free-air temperature	-40 to 85	°C
T <sub>J</sub> Maximum junction temperature	125	°C
T <sub>stg</sub> Storage temperature	-65 to 150	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability

**DISSIPATION RATINGS**

PACKAGE	T <sub>A</sub> ≤ 25°C POWER RATING	DERATING FACTOR ABOVE T <sub>A</sub> = 25°C	T <sub>A</sub> = 70°C POWER RATING	T <sub>A</sub> = 85°C POWER RATING
RSB <sup>(1)</sup>	2.94 W	32 mW/°C	1.47 W	1.18 W

- (1) The thermal resistance, junction-to-ambient (R<sub>θJA</sub>), of the RSB package is 34°C/W measured on a high K board.

**RECOMMENDED OPERATING CONDITIONS**

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V <sub>CC</sub> Input voltage range step-down converters (VINDCDC1, VINDCDC2, VINDCDC3)	2.5		6	V

## DETAILED DESCRIPTION

### VRTC OUTPUT AND OPERATION WITH OR WITHOUT BACKUP BATTERY

The VRTC pin is an always-on output, intended to supply up to 30 mA to a permanently required rail. The output voltage selected from a priority scheme based on the VSYSIN and VBACKUP pins. *Texas Instruments recommends that all DaVinci systems connect the VSYSIN and VBACKUP pins to ground and leave the VRTC output floating.*

When the voltage at the VSYSIN pin exceeds 2.65 V, VRTC is connected to the VSYSIN input via a PMOS switch and all other paths to VRTC are disabled. VSYSIN can be connected to any voltage source with the appropriate input voltage, including either DCDC2 or DCDC3 if set to 3.3V output. When VSYSIN is connected to ground or drops below 2.65V, the PMOS switch between VRTC and VSYSIN opens and VRTC is then connected to either VBACKUP or the output of a dedicated 3V/30mA LDO. *If VSYSIN is not going to be provided to the TPS65023, the VSYSIN input should be connected to GND.*

In applications using a backup battery, the backup voltage can be connected to the TPS65023 VBACKUP pin, directly if a single Li-Ion cell is used, or via a boost converter (e.g. TPS61070) if a single NiMH battery is used. If the connection between VRTC and VSYSIN is opened, VRTC will be connected to the VBACKUP input via a PMOS switch. The TPS65023 asserts the  $\overline{\text{RESPWRON}}$  signal if VRTC drops below 2.4 V. The PMOS switch connecting VBACKUP to VRTC drops 375 mV at 30 mA, setting the minimum voltage applied at VBACKUP to 2.775 V for normal operation. If the both switches between VRTC and VSYSIN or VBACKUP are open, the dedicated 3V/30mA LDO drives VRTC. *In systems where no backup battery is used, the VBACKUP pin should be connected to GND.*

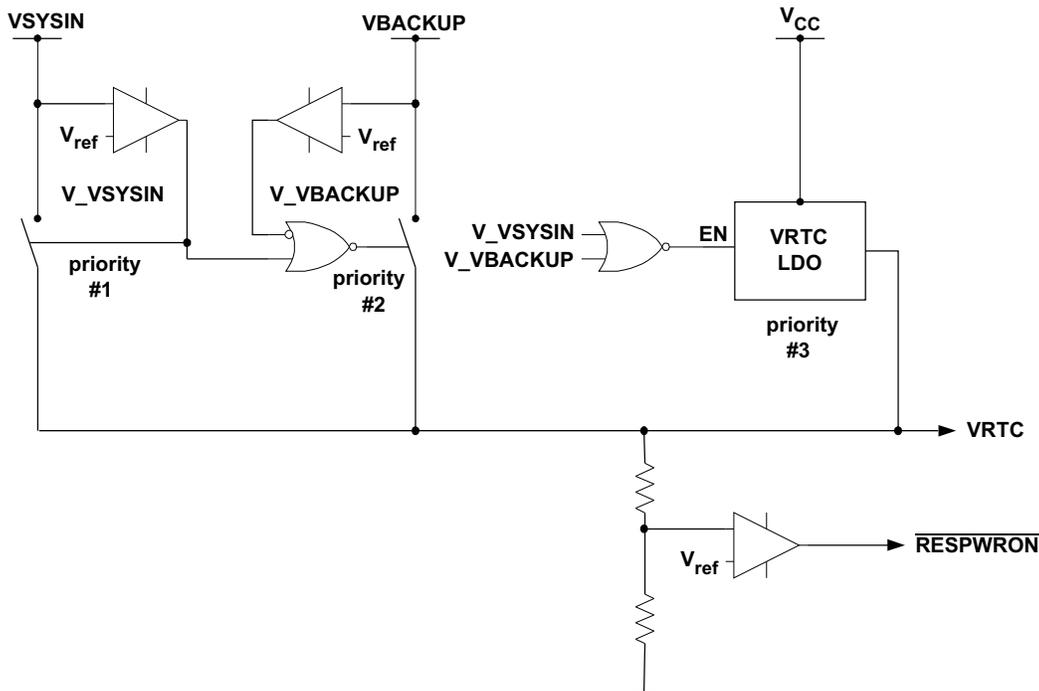

In systems where VSYSIN and VBACKUP inputs grounded, a dedicated low power LDO is enabled. This LDO is supplied from VCC and capable of delivering 30 mA to a 3 V output. This LDO is disabled if the voltage at the VSYSIN input exceeds 2.65 V. VRTC is then supplied from the external source connected to this pin as previously described.

Inside TPS65023 there is a switch (Vmax switch) which selects the higher voltage between VCC and VBACKUP. This is used as the supply voltage for some basic functions. The functions powered from the output of the Vmax switch are:

- $\overline{\text{INT}}$  output
- $\overline{\text{RESPWRON}}$  output
- $\overline{\text{HOT\_RESET}}$  input
- $\overline{\text{LOW\_BATT}}$  output
- $\overline{\text{PWRFAIL}}$  output
- Enable pins for dc-dc converters, LDO1 and LDO2
- Undervoltage lockout comparator (UVLO)
- Reference system with low frequency timing oscillators
- $\overline{\text{LOW\_BATT}}$  and  $\overline{\text{PWRFAIL}}$  comparators

The main 2.25-MHz oscillator, and the I<sup>2</sup>C™ interface are only powered from V<sub>CC</sub>.

**DETAILED DESCRIPTION (continued)**

- A.  $V\_VSYSIN$ ,  $V\_VBACKUP$  thresholds: falling = 2.55 V, rising = 2.65 V  $\pm 3\%$
- B.  $\overline{RESPWRON}$  thresholds: falling = 2.4 V, rising = 2.52 V  $\pm 3\%$

**Figure 26.**

**STEP-DOWN CONVERTERS, VDCDC1, VDCDC2, and VDCDC3**

The TPS65023 incorporates three synchronous step-down converters operating typically at 1.5 MHz fixed frequency pulse width modulation (PWM) at moderate to heavy load currents. At light load currents, the converters automatically enter the power save mode (PSM), and operate with pulse frequency modulation (PFM). The VDCDC1 converter is capable of delivering 1.5 A output current, the VDCDC2 converter is capable of delivering 1.2 A and the VDCDC3 converter is capable of delivering up to 1 A.

The converter output voltages can be programmed via the DEFDCDC1, DEFDCDC2 and DEFDCDC3 pins. The pins can either be connected to GND, VCC, or to a resistor divider between the output voltage and GND. The VDCDC1 converter defaults to 1.2 V or 1.8 V depending on the DEFDCDC1 configuration pin. If DEFDCDC1 is tied to ground, the default is 1.2 V. If it is tied to VCC, the default is 1.8 V. When the DEFDCDC1 pin is connected to a resistor divider, the output voltage can be set in the range of 0.6 V to  $V_{INDCDC1}$  V. See the application information section for more details. The core voltage can be reprogrammed via the serial interface in the range of 0.8 V to 1.6 V with a programmable slew rate. The converter is forced into PWM operation whilst any programmed voltage change is underway, whether the voltage is being increased or decreased. The DEFDCORE and DEFSLEW registers are used to program the output voltage and slew rate during voltage transitions.

The VDCDC2 converter defaults to 1.8 V or 2.5 V depending on the DEFDCDC2 configuration pin. If DEFDCDC2 is tied to ground, the default is 1.8 V. If it is tied to VCC, the default is 2.5 V. When the DEFDCDC2 pin is connected to a resistor divider, the output voltage can be set in the range of 0.6 V to  $V_{INDCDC2}$  V.

The VDCDC3 converter defaults to 1.8 V or 3.3 V depending on the DEFDCDC3 configuration pin. If DEFDCDC3 is tied to ground the default is 1.8 V. If it is tied to VCC, the default is 3.3 V. When the DEFDCDC3 pin is connected to a resistor divider, the output voltage can be set in the range of 0.6 V to  $V_{INDCDC3}$  V.

The step-down converter outputs (when enabled) are monitored by power good (PG) comparators, the outputs of which are available via the serial interface. The outputs of the dc-dc converters can be optionally discharged via on-chip 300- $\Omega$  resistors when the dc-dc converters are disabled.

## DETAILED DESCRIPTION (continued)

During PWM operation, the converters use a unique fast response voltage mode controller scheme with input voltage feed-forward to achieve good line and load regulation allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the P-channel MOSFET switch is turned on. The inductor current ramps up until the comparator trips and the control logic turns off the switch. The current limit comparator also turns off the switch if the current limit of the P-channel switch is exceeded. After the adaptive dead time used to prevent shoot through current, the N-channel MOSFET rectifier is turned on, and the inductor current ramps down. The next cycle is initiated by the clock signal, again turning off the N-channel rectifier and turning on the P-channel switch.

The three dc-dc converters operate synchronized to each other with the VDCDC1 converter as the master. A 180° phase shift between the VDCDC1 switch turn on and the VDCDC2 and a further 90° shift to the VDCDC3 switch turn on decreases the input RMS current and smaller input capacitors can be used. This is optimized for a typical application where the VDCDC1 converter regulates a Li-Ion battery voltage of 3.7 V to 1.2 V, the VDCDC2 converter from 3.7 V to 1.8 V, and the VDCDC3 converter from 3.7 V to 3.3 V. The phase of the three converters can be changed using the CON\_CTRL register.

## POWER SAVE MODE OPERATION

As the load current decreases, the converters enter the power save mode operation. During PSM, the converters operate in a burst mode (PFM mode) with a frequency between 750 kHz and 1.5 MHz, nominal for one burst cycle. However, the frequency between different burst cycles depends on the actual load current and is typically far less than the switching frequency with a minimum quiescent current to maintain high efficiency.

In order to optimize the converter efficiency at light load, the average current is monitored and if in PWM mode the inductor current remains below a certain threshold, then PSM is entered. The typical threshold to enter PSM is calculated as follows:

$$\begin{aligned}
 I_{\text{PFMDCDC1 enter}} &= \frac{V_{\text{INDCDC1}}}{24 \Omega} \\
 I_{\text{PFMDCDC2 enter}} &= \frac{V_{\text{INDCDC2}}}{26 \Omega} \\
 I_{\text{PFMDCDC3 enter}} &= \frac{V_{\text{INDCDC3}}}{39 \Omega}
 \end{aligned} \tag{1}$$

During the PSM the output voltage is monitored with a comparator, and by maximum skip burst width. As the output voltage falls below the threshold, set to the nominal  $V_O$ , the P-channel switch turns on and the converter effectively delivers a constant current defined as follows.

$$\begin{aligned}
 I_{\text{PFMDCDC1 leave}} &= \frac{V_{\text{INDCDC1}}}{18 \Omega} \\
 I_{\text{PFMDCDC2 leave}} &= \frac{V_{\text{INDCDC2}}}{20 \Omega} \\
 I_{\text{PFMDCDC3 leave}} &= \frac{V_{\text{INDCDC3}}}{29 \Omega}
 \end{aligned} \tag{2}$$

If the load is below the delivered current then the output voltage rises until the same threshold is crossed in the other direction. All switching activity ceases, reducing the quiescent current to a minimum until the output voltage has again dropped below the threshold. The power save mode is exited, and the converter returns to PWM mode if either of the following conditions are met:

1. the output voltage drops 2% below the nominal  $V_O$  due to increasing load current
2. the PFM burst time exceeds  $16 \times 1/f_s$  (10.67  $\mu\text{s}$  typical).

## DETAILED DESCRIPTION (continued)

These control methods reduce the quiescent current to typically 14  $\mu\text{A}$  per converter, and the switching activity to a minimum, thus achieving the highest converter efficiency. Setting the comparator thresholds at the nominal output voltage at light load current results in a low output voltage ripple. The ripple depends on the comparator delay and the size of the output capacitor. Increasing capacitor values makes the output ripple tend to zero. The PSM is disabled through the I<sup>2</sup>C interface to force the individual converters to stay in fixed frequency PWM mode.

### LOW RIPPLE MODE

Setting Bit 3 in register CON-CTRL to 1 enables the low ripple mode for all of the dc-dc converters if operated in PFM mode. For an output current less than approximately 10 mA, the output voltage ripple in PFM mode is reduced, depending on the actual load current. The lower the actual output current on the converter, the lower the output ripple voltage. For an output current above 10 mA, there is only minor difference in output voltage ripple between PFM mode and low ripple PFM mode. As this feature also increases switching frequency, it is used to keep the switching frequency above the audible range in PFM mode down to a low output current.

### SOFT START

Each of the three converters has an internal soft start circuit that limits the inrush current during start-up. The soft start is realized by using a very low current to initially charge the internal compensation capacitor. The soft start time is typically 750  $\mu\text{s}$  if the output voltage ramps from 5% to 95% of the final target value. If the output is already precharged to some voltage when the converter is enabled, then this time is reduced proportionally. There is a short delay of typically 170  $\mu\text{s}$  between the converter being enabled and switching activity actually starting. This is to allow the converter to bias itself properly, to recognize if the output is precharged, and if so to prevent discharging of the output while the internal soft start ramp catches up with the output voltage.

### 100% DUTY CYCLE LOW DROPOUT OPERATION

The TPS65023 converters offer a low input to output voltage difference while still maintaining operation with the use of the 100% duty cycle mode. In this mode the P-channel switch is constantly turned on. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range. The minimum input voltage required to maintain dc regulation depends on the load current and output voltage. It is calculated as:

$$V_{in\_min} = V_{out\_min} + I_{out\_max} \times (r_{DS(on)\_max} + R_L) \quad (3)$$

with:

$I_{out\_max}$  = maximum load current (Note: ripple current in the inductor is zero under these conditions)

$r_{DS(on)\_max}$  = maximum P-channel switch  $r_{DS(on)}$

$R_L$  = DC resistance of the inductor

$V_{out\_min}$  = nominal output voltage minus 2% tolerance limit

### ACTIVE DISCHARGE WHEN DISABLED

When the VDCDC1, VDCDC2, and VDCDC3 converters are disabled, due to an UVLO, DCDC\_EN or OVERTEMP condition, it is possible to actively pull down the outputs. This feature is disabled per default and is individually enabled via the CON\_CTRL2 register in the serial interface. When this feature is enabled, the VDCDC1, VDCDC2, and VDCDC3 outputs are discharged by a 300  $\Omega$  (typical) load which is active as long as the converters are disabled.

### POWER GOOD MONITORING

All three step-down converters and both the LDO1 and LDO2 linear regulators have power good comparators. Each comparator indicates when the relevant output voltage has dropped 10% below its target value with 5% hysteresis. The outputs of these comparators are available in the PGOODZ register via the serial interface. An interrupt is generated when any voltage rail drops below the 10% threshold. The comparators are disabled when the converters are disabled and the relevant PGOODZ register bits indicate that power is good.

## DETAILED DESCRIPTION (continued)

### LOW DROPOUT VOLTAGE REGULATORS

The low dropout voltage regulators are designed to operate well with low value ceramic input and output capacitors. They operate with input voltages down to 1.5 V. The LDOs offer a maximum dropout voltage of 300 mV at rated output current. Each LDO supports a current limit feature. Both LDOs are enabled by the LDO\_EN pin, both LDOs can be disabled or programmed via the serial interface using the REG\_CTRL and LDO\_CTRL registers. The LDOs also have reverse conduction prevention. This allows the possibility to connect external regulators in parallel in systems with a backup battery. The TPS65023 step-down and LDO voltage regulators automatically power down when the  $V_{CC}$  voltage drops below the UVLO threshold or when the junction temperature rises above 160°C.

### POWER GOOD MONITORING

Both the LDO1 and LDO2 linear regulators have power good comparators. Each comparator indicates when the relevant output voltage has dropped 10% below its target value, with 5% hysteresis. The outputs of these comparators are available in the PGOODZ register via the serial interface. An interrupt is generated when any voltage rail drops below the 10% threshold. The comparators are disabled when the LDOs are disabled and the relevant PGOODZ register bits indicate that power is good.

### UNDERVOLTAGE LOCKOUT

The undervoltage lockout circuit for the five regulators on the TPS65023 prevents the device from malfunctioning at low-input voltages and from excessive discharge of the battery. It disables the converters and LDOs. The UVLO circuit monitors the VCC pin, the threshold is set internally to 2.35 V with 5% (120 mV) hysteresis. Note that when any of the dc-dc converters are running, there is an input current at the VCC pin, which is up to 3 mA when all three converters are running in PWM mode. This current needs to be taken into consideration if an external RC filter is used at the VCC pin to remove switching noise from the TPS65023 internal analog circuitry supply.

### POWER-UP SEQUENCING

The TPS65023 power-up sequencing is designed to be entirely flexible and customer driven. This is achieved by providing separate enable pins for each switch-mode converter, and a common enable signal for the LDOs. The relevant control pins are described in [Table 2](#).

**Table 2. Control Pins and Status Outputs for DC-DC Converters**

PIN NAME	I/O	FUNCTION
DEFDCDC3	I	Defines the default voltage of the VDCDC3 switching converter. DEFDCDC3 = 0 defaults VDCDC3 to 1.8 V, DEFDCDC3 = VCC defaults VDCDC3 to 3.3 V.
DEFDCDC2	I	Defines the default voltage of the VDCDC2 switching converter. DEFDCDC2 = 0 defaults VDCDC2 to 1.8 V, DEFDCDC2 = VCC defaults VDCDC2 to 3.3 V.
DEFDCDC1	I	Defines the default voltage of the VDCDC1 switching converter. DEFDCDC1 = 0 defaults VDCDC1 to 1.2 V, DEFDCDC1 = VCC defaults VDCDC1 to 1.6 V.
DCDC3_EN	I	Set DCDC3_EN = 0 to disable and DCDC3_EN = 1 to enable the VDCDC3 converter
DCDC2_EN	I	Set DCDC2_EN = 0 to disable and DCDC2_EN = 1 to enable the VDCDC2 converter
DCDC1_EN	I	Set DCDC1_EN = 0 to disable and DCDC1_EN = 1 to enable the VDCDC1 converter
HOT_RESET	I	The <b>HOT_RESET</b> pin generates a reset ( <b>RESPWRON</b> ) for the processor. <b>HOT_RESET</b> does not alter any TPS65023 settings except the output voltage of VDCDC1. Activating <b>HOT_RESET</b> sets the voltage of VDCDC1 to its default value defined with the DEFDCDC1 pin. <b>HOT_RESET</b> is internally de-bounced by the TPS65023.
RESPWRON	O	<b>RESPWRON</b> is held low when power is initially applied to the TPS65023. The VRTC voltage is monitored: <b>RESPWRON</b> is low when VRTC < 2.4 V and remains low for a time defined by the external capacitor at the TRESPWRON pin. <b>RESPWRON</b> can also be forced low by activation of the <b>HOT_RESET</b> pin.
TRESPWRON	I	Connect a capacitor here to define the RESET time at the <b>RESPWRON</b> pin (1 nF typically gives 100 ms).

## SYSTEM RESET + CONTROL SIGNALS

The  $\overline{\text{RESPWRON}}$  signal can be used as a global reset for the application. It is an open drain output. The  $\overline{\text{RESPWRON}}$  signal is generated according to the power good comparator of VRTC, and remains low for  $t_{\text{respwrn}}$  seconds after VRTC has risen above 2.52 V (falling threshold is 2.4 V, 5% hysteresis).  $t_{\text{respwrn}}$  is set by an external capacitor at the TRESPWRON pin. 1 nF gives typically 100 ms.  $\overline{\text{RESPWRON}}$  is also triggered by the  $\overline{\text{HOT\_RESET}}$  input. This input is internally debounced, with a filter time of typically 30 ms.

The  $\overline{\text{PWRFAIL}}$  and  $\overline{\text{LOW\_BAT}}$  signals are generated by two voltage detectors using the PWRFAIL\_SNS and LOWBAT\_SNS input signals. Each input signal is compared to a 1 V threshold (falling edge) with 5% (50 mV) hysteresis.

The DCDC1 converter is reset to its default output voltage defined by the DEFDCDC1 input, when  $\overline{\text{HOT\_RESET}}$  is asserted. Other I<sup>2</sup>C registers are not affected. Generally, the DCDC1 converter is set to its default voltage with one of these conditions:  $\overline{\text{HOT\_RESET}}$  active, VRTC lower than its threshold voltage, undervoltage lockout (UVLO) condition, or  $\overline{\text{RESPWRON}}$  active.

### DEFLDO1 and DEFLDO2

These two pins are used to set the default output voltage of the two 200 mA LDOs. The digital value applied to the pins is latched during power up and determines the initial output voltage according to Table 3. The voltage of both LDOs can be changed during operation with the I<sup>2</sup>C interface as described in the interface description.

**Table 3.**

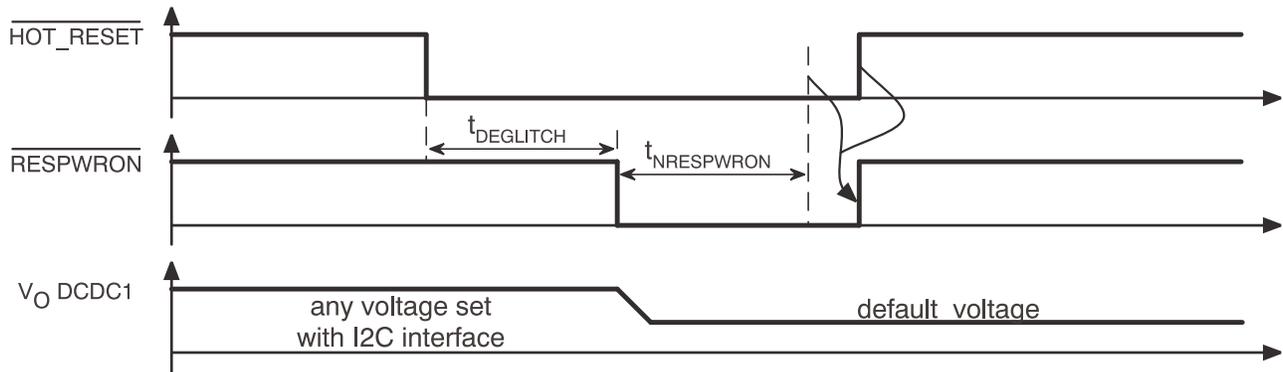

DEFLDO2	DEFLDO1	VLDO1	VLDO2
0	0	1.3 V	3.3 V
0	1	2.8 V	3.3 V
1	0	1.3 V	1.8 V
1	1	1.8 V	3.3 V

### Interrupt Management and the $\overline{\text{INT}}$ Pin

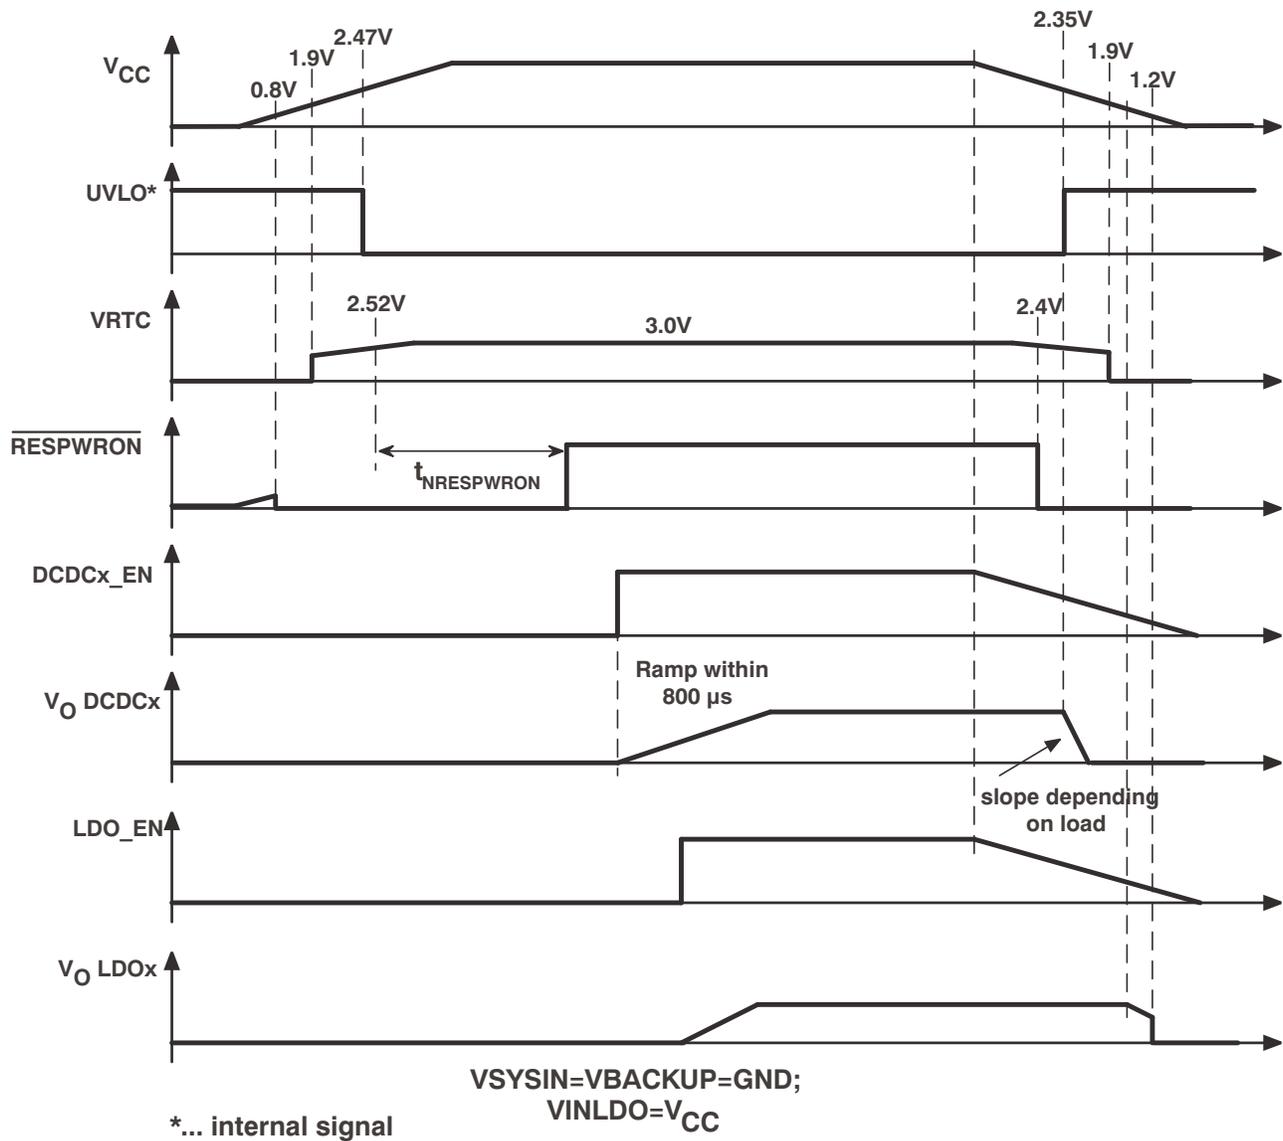

The  $\overline{\text{INT}}$  pin combines the outputs of the PGOOD comparators from each dc-dc converter and LDOs. The  $\overline{\text{INT}}$  pin is used as a POWER\_OK pin indicating when all enabled supplies are in regulation. If the PGOODZ register is read via the serial interface, any active bits are then blocked from the  $\overline{\text{INT}}$  output pin.

Interrupts can be masked using the MASK register; default operation is not to mask any DCDC or LDO interrupts since this provides the POWER\_OK function.

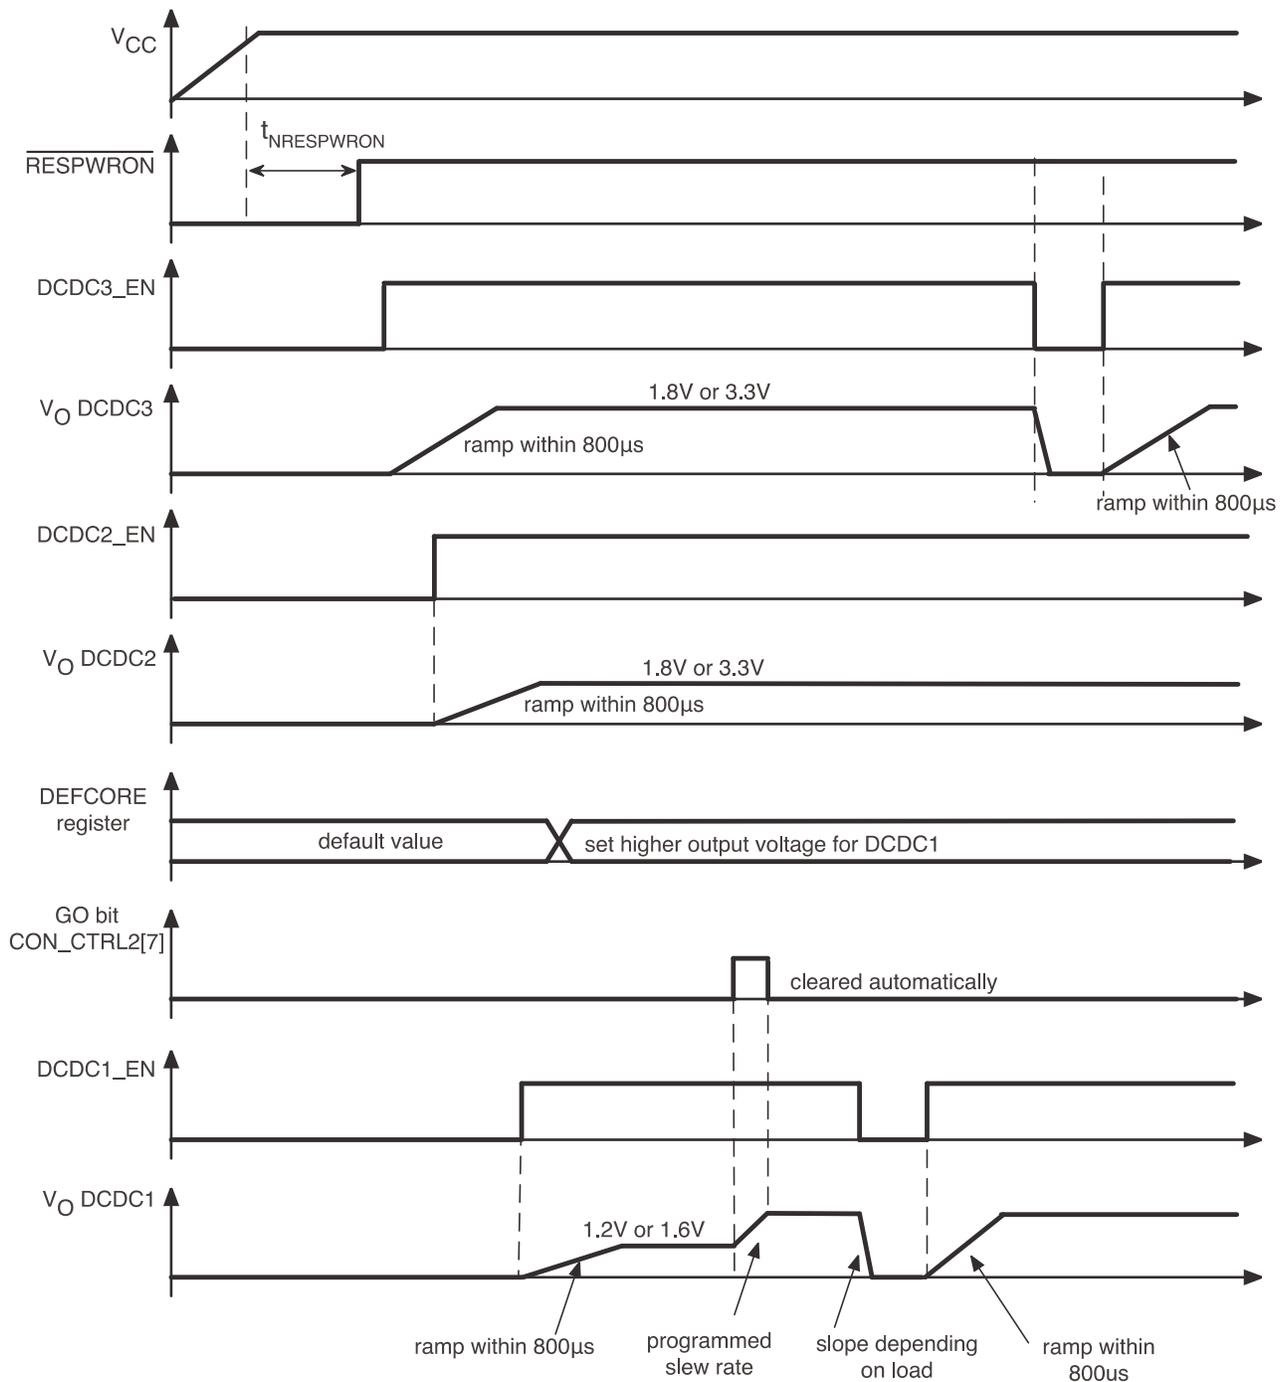

**TIMING DIAGRAMS**

**Figure 27. HOT\_RESET Timing**

**Figure 28. Power-Up and Power-Down Timing**

**Figure 29. DVS Timing**

## SERIAL INTERFACE

The serial interface is compatible with the standard and fast mode I<sup>2</sup>C specifications, allowing transfers at up to 400 kHz. The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements and charger status to be monitored. Register contents remain intact as long as V<sub>CC</sub> remains above 2 V. The TPS65023 has a 7-bit address: 1001000, other addresses are available upon contact with the factory. Attempting to read data from the register addresses not listed in this section results in FFh being read out.

For normal data transfer, DATA is allowed to change only when CLK is low. Changes when CLK is high are reserved for indicating the start and stop conditions. During data transfer, the data line must remain stable whenever the clock line is high. There is one clock pulse per bit of data. Each data transfer is initiated with a start condition and terminated with a stop condition. When addressed, the TPS65023 device generates an acknowledge bit after the reception of each byte. The master device (microprocessor) must generate an extra clock pulse that is associated with the acknowledge bit. The TPS65023 device must pull down the DATA line during the acknowledge clock pulse so that the DATA line is a stable low during the high period of the acknowledge clock pulse. The DATA line is a stable low during the high period of the acknowledge-related clock pulse. Setup and hold times must be taken into account. During read operations, a master must signal the end of data to the slave by not generating an acknowledge bit on the last byte that was clocked out of the slave. In this case, the slave TPS65023 device must leave the data line high to enable the master to generate the stop condition

Read/Write	R	R	R	R	R	R	R	R

**Bit 7 PWRFAILZ:**

0 = indicates that the PWRFAIL\_SNS input voltage is above the 1-V threshold.

1 = indicates that the PWRFAIL\_SNS input voltage is below the 1-V threshold.

**Bit 6 LOWBATTZ:**

0 = indicates that the LOWBATT\_SNS input voltage is above the 1-V threshold.

1 = indicates that the LOWBATT\_SNS input voltage is below the 1-V threshold.

**Bit 5 PGOODZ VDCDC1:**

0 = indicates that the VDCDC1 converter output voltage is within its nominal range. This bit is zero if the VDCDC1 converter is disabled.

1 = indicates that the VDCDC1 converter output voltage is below its target regulation voltage

**Bit 4 PGOODZ VDCDC2:**

0 = indicates that the VDCDC2 converter output voltage is within its nominal range. This bit is zero if the VDCDC2 converter is disabled.

1 = indicates that the VDCDC2 converter output voltage is below its target regulation voltage

**Bit 3 PGOODZ VDCDC3:**

0 = indicates that the VDCDC3 converter output voltage is within its nominal range. This bit is zero if the VDCDC3 converter is disabled and during a DVM controlled output voltage transition

1 = indicates that the VDCDC3 converter output voltage is below its target regulation voltage

**Bit 2 PGOODZ LDO2:**

0 = indicates that the LDO2 output voltage is within its nominal range. This bit is zero if LDO2 is disabled.

1 = indicates that LDO2 output voltage is below its target regulation voltage

**Bit 1 PGOODZ LDO1**

0 = indicates that the LDO1 output voltage is within its nominal range. This bit is zero if LDO1 is disabled.

1 = indicates that the LDO1 output voltage is below its target regulation voltage

**MASK. Register Address: 02h (read/write)      Default Value: C0h**

MASK	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function	MASK PWRFAILZ	MASK LOWBATTZ	MASK VDCDC1	MASK VDCDC2	MASK VDCDC3	MASK LDO2	MASK LDO1	
Default	1	1	0	0	0	0	0	0
Default value loaded by:	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO	
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	

The MASK register can be used to mask particular fault conditions from appearing at the  $\overline{\text{INT}}$  pin. MASK<n> = 1 masks PGOODZ<n>.

**REG\_CTRL. Register Address: 03h (read/write)      Default Value: FFh**

The REG\_CTRL register is used to disable or enable the power supplies via the serial interface. The contents of the register are logically AND'ed with the enable pins to determine the state of the supplies. A UVLO condition resets the REG\_CTRL to 0xFF, so the state of the supplies defaults to the state of the enable pin. The REG\_CTRL bits are automatically reset to default when the corresponding enable pin is low.

REG_CTRL	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function			VDCDC1 ENABLE	VDCDC2 ENABLE	VDCDC3 ENABLE	LDO2 ENABLE	LDO1 ENABLE	
Default	1	1	1	1	1	1	1	1
Set by signal			DCDC1_ENZ	DCDC2_ENZ	DCDC3_ENZ	LDO_ENZ	LDO_ENZ	
Default value loaded by:			UVLO	UVLO	UVLO	UVLO	UVLO	
Read/Write			R/W	R/W	R/W	R/W	R/W	

**Bit 5 VDCDC1 ENABLE**

DCDC1 Enable. This bit is logically AND'ed with the state of the DCDC1\_EN pin to turn on the DCDC1 converter. Reset to 1 by a UVLO condition, the bit can be written to 0 or 1 via the serial interface. The bit is reset to 1 when the pin DCDC1\_EN is pulled to GND, allowing DCDC1 to turn on when DCDC1\_EN returns high.

**Bit 4 VDCDC2 ENABLE**

DCDC2 Enable. This bit is logically AND'ed with the state of the DCDC2\_EN pin to turn on the DCDC2 converter. Reset to 1 by a UVLO condition, the bit can be written to 0 or 1 via the serial interface. The bit is reset to 1 when the pin DCDC2\_EN is pulled to GND, allowing DCDC2 to turn on when DCDC2\_EN returns high.

**Bit 3 VDCDC3 ENABLE**

DCDC3 Enable. This bit is logically AND'ed with the state of the DCDC3\_EN pin to turn on the DCDC3 converter. Reset to 1 by a UVLO condition, the bit can be written to 0 or 1 via the serial interface. The bit is reset to 1 when the pin DCDC3\_EN is pulled to GND, allowing DCDC3 to turn on when DCDC3\_EN returns high.

**Bit 2 LDO2 ENABLE**

LDO2 Enable. This bit is logically AND'ed with the state of the LDO2\_EN pin to turn on LDO2. Reset to 1 by a UVLO condition, the bit can be written to 0 or 1 via the serial interface. The bit is reset to 1 when the pin LDO\_EN is pulled to GND, allowing LDO2 to turn on when LDO\_EN returns high.

**Bit 1 LDO1 ENABLE**

LDO1 Enable. This bit is logically AND'ed with the state of the LDO1\_EN pin to turn on LDO1. Reset to 1 by a UVLO condition, the bit can be written to 0 or 1 via the serial interface. The bit is reset to 1 when the pin LDO\_EN is pulled to GND, allowing LDO1 to turn on when LDO\_EN returns high.

**CON\_CTRL. Register Address: 04h (read/write)      Default Value: B1h**

CON_CTRL	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function	DCDC2 PHASE1	DCDC2 PHASE0	DCDC3 PHASE1	DCDC3 PHASE0	LOW RIPPLE	FPWM DCDC2	FPWM DCDC1	FPWM DCDC3
Default	1	0	1	1	0	0	0	0
Default value loaded by:	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The CON\_CTRL register is used to force any or all of the converters into forced PWM operation, when low output voltage ripple is vital. It is also used to control the phase shift between the three converters in order to minimize the input rms current, hence reduce the required input blocking capacitance. The DCDC1 converter is taken as the reference and consequently has a fixed zero phase shift.

CON_CTRL<7:6>	DCDC2 CONVERTER DELAYED BY	CON_CTRL<5:4>	DCDC3 CONVERTER DELAYED BY
00	zero	00	zero
01	1/4 cycle	01	1/4 cycle
<b>10</b>	<b>1/2 cycle</b>	10	1/2 cycle
11	3/4 cycle	<b>11</b>	<b>3/4 cycle</b>

**Bit 3    LOW RIPPLE:**

- 0 =    PFM mode operation optimized for high efficiency for all converters
- 1 =    PFM mode operation optimized for low output voltage ripple for all converters

**Bit 2    FPWM DCDC2:**

- 0 =    DCDC2 converter operates in PWM / PFM mode
- 1 =    DCDC2 converter is forced into fixed frequency PWM mode

**Bit 1    FPWM DCDC1:**

- 0 =    DCDC1 converter operates in PWM / PFM mode
- 1 =    DCDC1 converter is forced into fixed frequency PWM mode

**Bit 0    FPWM DCDC3:**

- 0 =    DCDC3 converter operates in PWM / PFM mode
- 1 =    DCDC3 converter is forced into fixed frequency PWM mode

**CON\_CTRL2. Register Address: 05h (read/write) Default Value: 40h**

CON_CTRL2	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function	GO	Core adj allowed				DCDC2 discharge	DCDC1 discharge	DCDC3 discharge
Default	0	1	0	0	0	0	0	0
Default value loaded by:	UVLO + DONE	RESET(1)				UVLO	UVLO	UVLO
Read/Write	R/W	R/W				R/W	R/W	R/W

The CON\_CTRL2 register can be used to take control the inductive converters.

RESET(1): CON\_CTRL2[6] is reset to its default value by one of these events:

- undervoltage lockout (UVLO)
- HOT\_RESET pulled low
- RESPWRON active
- VRTC below threshold

Bit 7 GO:

0 = no change in the output voltage for the DCDC1 converter

1 = the output voltage of the DCDC1 converter is changed to the value defined in DEFDCORE with the slew rate defined in DEFSLEW. This bit is automatically cleared when the DVM transition is complete. The transition is considered complete in this case when the desired output voltage code has been reached, not when the VDCDC3 output voltage is actually in regulation at the desired voltage.

Bit 6 CORE ADJ Allowed:

0 = the output voltage is set with the I<sup>2</sup>C register

1 = DEFDCDC1 is either connected to GND or VCC or an external voltage divider. When connected to GND or VCC, VDCDC1 defaults to 1.2 V or 1.6 V respectively at start-up

Bit 2–0 0 = the output capacitor of the associated converter is not actively discharged when the converter is disabled

1 = the output capacitor of the associated converter is actively discharged when the converter is disabled. This decreases the fall time of the output voltage at light load

**DEFCORE. Register Address: 06h (read/write) Default Value: 14h/1Eh**

DEFCORE	B7	B6	B5	B4	B3	B2	B1	B0

0	1	1	1.8 V	0	1	1	1.8 V
1	0	0	2.5 V	1	0	0	2.2 V
1	0	1	2.8 V	1	0	1	2.6 V
1	1	0	3.0 V	1	1	0	2.8 V
1	1	1	3.3 V	1	1	1	3.15 V

## DESIGN PROCEDURE

### Inductor Selection for the DC-DC Converters

Each of the converters in the TPS65023 typically use a 2.2 μH output inductor. Larger or smaller inductor values are used to optimize the performance of the device for specific operation conditions. The selected inductor has to be rated for its dc resistance and saturation current. The dc resistance of the inductance influences directly the efficiency of the converter. Therefore, an inductor with lowest dc resistance should be selected for highest efficiency.

For a fast transient response, a 2.2-μH inductor in combination with a 22-μF output capacitor is recommended.

[Equation 4](#) calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with [Equation 4](#). This is needed because during heavy load transient the inductor current rises above the value calculated under [Equation 4](#).

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad (4)$$

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2} \quad (5)$$

with:

f = Switching Frequency (2.25 MHz typical)

L = Inductor Value

$\Delta I_L$  = Peak-to-Peak inductor ripple current

$I_{LMAX}$  = Maximum Inductor current

The highest inductor current occurs at maximum  $V_{in}$ .

Open core inductors have a soft saturation characteristic, and they can usually handle higher inductor currents versus a comparable shielded inductor.

A more conservative approach is to select the inductor current rating just for the maximum switch current of the TPS65023 (2 A for the VDCDC1 and VDCDC2 converters, and 1.5 A for the VDCDC3 converter). The core material from inductor to inductor differs and has an impact on the efficiency especially at high switching frequencies.

See [Table 4](#) and the typical applications for possible inductors.

**Table 4. Tested Inductors**

DEVICE	INDUCTOR VALUE	TYPE	COMPONENT SUPPLIER
All Converters	2.2 μH	LPS4012-222LMB	Coilcraft
	2.2 μH	VLCF4020T-2R2N1R7	TDK

### Output Capacitor Selection

The advanced Fast Response voltage mode control scheme of the inductive converters implemented in the TPS65023 allow the use of small ceramic capacitors with a typical value of 10 μF for each converter without having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values have the lowest output voltage ripple and are recommended. See [Table 5](#) for recommended components.

If ceramic output capacitors are used, the capacitor RMS ripple current rating always meets the application requirements. Just for completeness, the RMS ripple current is calculated as:

$$I_{\text{RMS}C_{\text{out}}} = V_{\text{out}} \times \frac{1 - \frac{V_{\text{out}}}{V_{\text{in}}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \quad (6)$$

At nominal load current, the inductive converters operate in PWM mode. The overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$\Delta V_{\text{out}} = V_{\text{out}} \times \frac{1 - \frac{V_{\text{out}}}{V_{\text{in}}}}{L \times f} \times \left( \frac{1}{8 \times C_{\text{out}} \times f} + \text{ESR} \right) \quad (7)$$

Where the highest output voltage ripple occurs at the highest input voltage  $V_{\text{in}}$ .

At light load currents, the converters operate in PSM and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1% of the nominal output voltage.

### Input Capacitor Selection

Because of the nature of the buck converter having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. Each dc-dc converter requires a 10-μF ceramic input capacitor on its input pin  $V_{\text{INDCDCx}}$ . The input capacitor is increased without any limit for better input voltage filtering. The VCC pin is separated from the input for the dc-dc converters. A filter resistor of up to 10R and a 1-μF capacitor is used for decoupling the VCC pin from switching noise. Note that the filter resistor may affect the UVLO threshold since up to 3 mA can flow via this resistor into the VCC pin when all converters are running in PWM mode.

**Table 5. Possible Capacitors**

CAPACITOR VALUE	CASE SIZE	COMPONENT SUPPLIER	COMMENTS
22 μF	1206	TDK C3216X5R0J226M	Ceramic

**Table 5. Possible Capacitors (continued)**

CAPACITOR VALUE	CASE SIZE	COMPONENT SUPPLIER	COMMENTS
10 $\mu$ F	0805	TDK C2012X5R0J106M	Ceramic

**Output Voltage Selection**

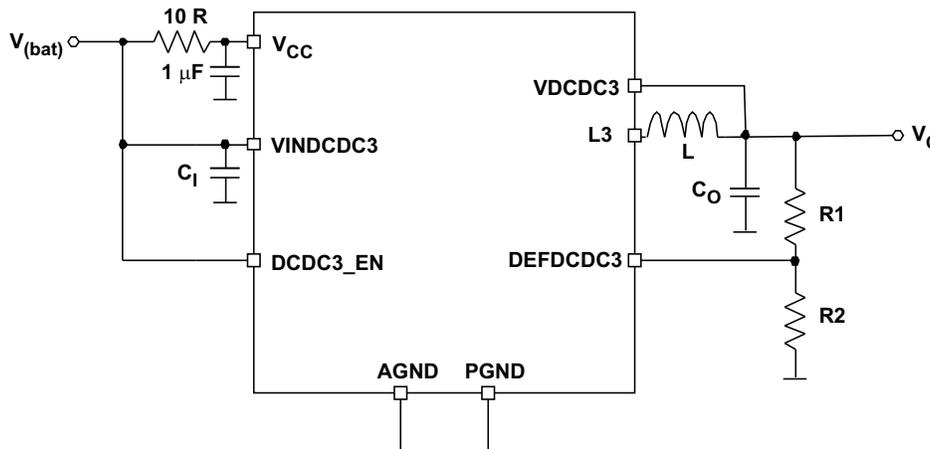

The DEFDCDC1, DEFDCDC2, and DEFDCDC3 pins are used to set the output voltage for each step-down converter. See Table 6 for the default voltages if the pins are pulled to GND or to VCC. If a different voltage is needed, an external resistor divider can be added to the DEFDCDCx pin as shown in Figure 36.

The output voltage of VDCDC1 is set with the I<sup>2</sup>C interface. If the voltage is changed from the default, using the DEFDCORE register, the output voltage only depends on the register value. Any resistor divider at DEFDCDC1 does not change the voltage set with the register.

**Table 6.**

PIN	LEVEL	DEFAULT OUTPUT VOLTAGE
DEFDCDC1	VCC	1.6 V
	GND	1.2 V
DEFDCDC2	VCC	3.3 V
	GND	1.8 V
DEFDCDC3	VCC	3.3 V
	GND	1.8 V

Using an external resistor divider at DEFDCDCx:

**Figure 36. External Resistor Divider**

When a resistor divider is connected to DEFDCDCx, the output voltage can be set from 0.6 V up to the input voltage V<sub>(bat)</sub>. The total resistance (R1+R2) of the voltage divider should be kept in the 1-MR range in order to maintain a high efficiency at light load.

$$V_{(DEFDCDCx)} = 0.6 \text{ V}$$

$$V_{OUT} = V_{DEFDCDCx} \times \frac{R1 + R2}{R2} \quad R1 = R2 \times \left( \frac{V_{OUT}}{V_{DEFDCDCx}} \right) - R2 \tag{8}$$

**VRTC Output**

The VRTC output is typically connected to the Vcc\_Batt pin of a Intel® PXA270 processor. During power-up of the processor, the TPS65023 internally switches from the LDO or the backup battery to the system voltage connected at the VSYSIN pin (see Figure 26). It is recommended that a 4.7- $\mu$ F (minimum) capacitor be added to the VRTC pin.

## LDO1 and LDO2

The LDOs in the TPS65023 are general-purpose LDOs which are stable using ceramics capacitors. The minimum output capacitor required is 2.2  $\mu\text{F}$ . The LDOs output voltage can be changed to different voltages between 1 V and 3.3 V using the I<sup>2</sup>C interface. Therefore, they can also be used as general-purpose LDOs in applications powering processors different from PXA270. The supply voltage for the LDOs needs to be connected to the VINLDO pin, giving the flexibility to connect the lowest voltage available in the system and provides the highest efficiency.

## TRESPWRON

This is the input to a capacitor that defines the reset delay time after the voltage at VRTC rises above 2.52 V. The timing is generated by charging and discharging the capacitor with a current of 2  $\mu\text{A}$  between a threshold of 0.25 V and 1 V for 128 cycles. A 1-nF capacitor gives a delay time of 100 ms.

$$t_{(\text{reset})} = 2 \times 128 \times \left( \frac{(1 \text{ V} - 0.25 \text{ V}) \times C_{(\text{reset})}}{2 \mu\text{A}} \right) \quad (9)$$

Where:

$t_{(\text{reset})}$  is the reset delay time

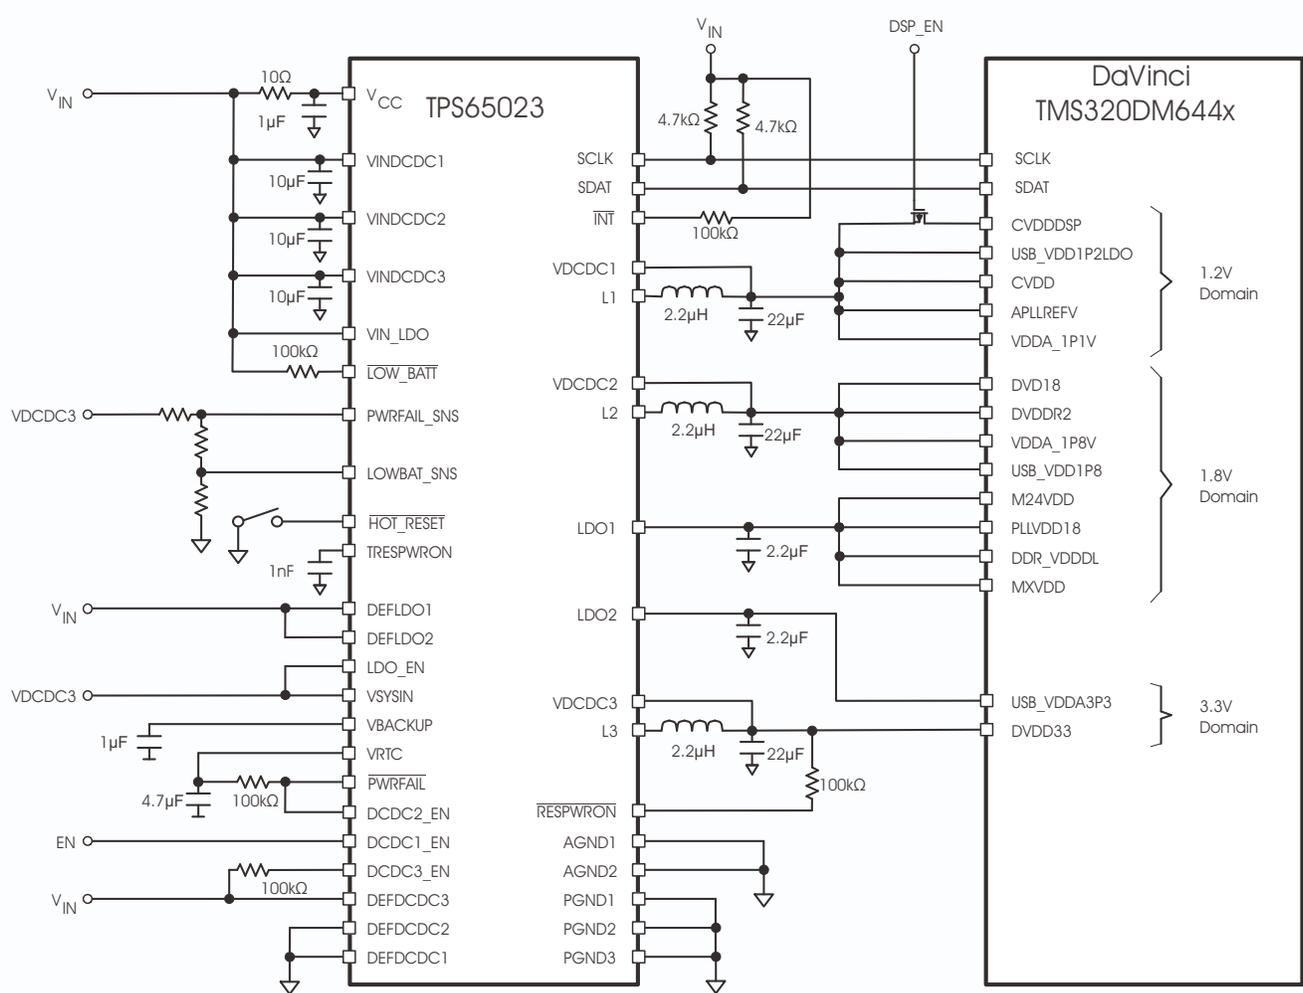

$C_{(\text{reset})}$  is the capacitor connected to the TRESPWRON pin

## V<sub>CC</sub>-Filter

An RC filter connected at the VCC input is used to keep noise from the internal supply for the bandgap and other analog circuitry. A typical value of 10 R and 1  $\mu\text{F}$  is used to filter the switching spikes, generated by the dc-dc converters. A larger resistor than 10 R should not be used because the current into VCC of up to 3 mA causes a voltage drop at the resistor causing the undervoltage lockout circuitry connected at VCC internally to switch off too early.

APPLICATION INFORMATION

TYPICAL CONFIGURATION FOR THE Texas Instruments® TMS320DM644x DaVinci PROCESSORS

Reset Condition of DCDC1

If DEFDCDC1 is connected to ground and DCDC1\_EN is pulled high after VINDCDC1 is applied, the output voltage of DCDC1 defaults to 1.225V instead of 1.2V (high by 2%). [Figure 37](#) illustrates the problem.

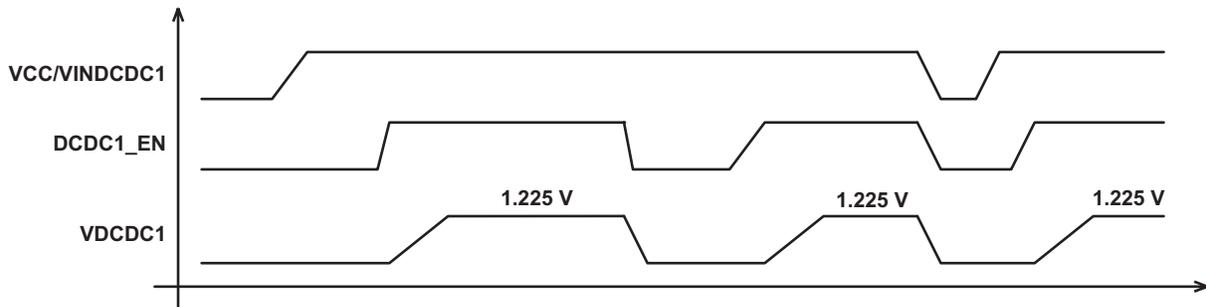

Figure 37. Default DCDC1

Workaround 1: Tie DCDC1\_EN to VINDCDC1 ([Figure 38](#))

APPLICATION INFORMATION (continued)

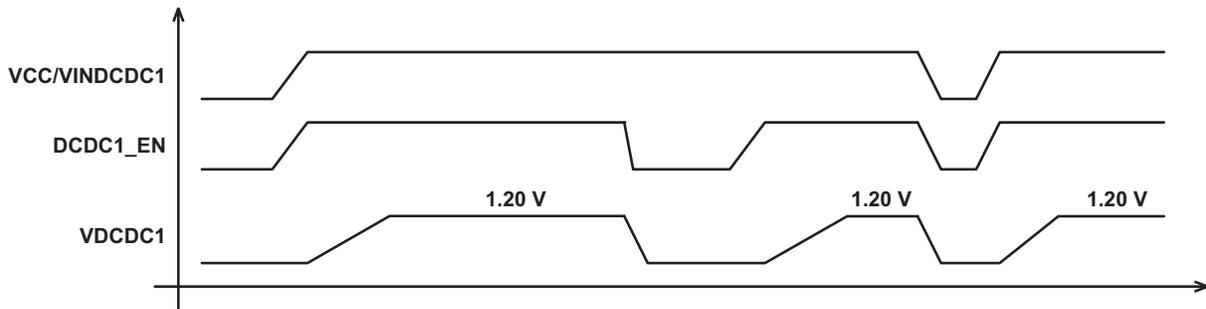

Figure 38. Workaround 1

Workaround 2: Write the correct voltage to the DEF\_CORE register via I<sup>2</sup>C. This can be done before or after the converter is enabled. If written before the enable, the only bit changed is DEF\_CORE[0]. The voltage will be 1.2V, however, when the enable is pulled high (Figure 39).

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) Package configuration.
  -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB), the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to a ground plane or special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
